06

Demos

Generative AI trends

93%

organizations are experimenting
with multiple models¹

61%

people are wary about
trusting AI systems³

50%

generative AI will launch agentic AI
pilots or POC by 2027²

30%

or fewer generative AI experiments
moved to production by most
respondents⁴

Generative AI trends

Organizations face significant challenges with complex, manual, and time-consuming workflows and minimal automation

**Inefficiency
and High
Operational
Costs**

**Lack of
Visibility &
Control**

Human Error

**Scalability
Issues**

Generative AI trends

The
opportunity for
autonomous AI
is growing...

By 2028, at least **15% of day-to-day work decisions** will be made autonomously through agentic AI, up from 0% in 2024.*

Agentic AI

A New Frontier

What is an AI agent?

An AI agent is a micro-service that takes **1** unstructured messages, optionally **2** invokes other APIs and **3** returns messages

Unlike previous tools, AI Agent can...

 reason,  act and  learn

Agentic patterns

Reasoning aka planning

Create a JSON describing
the user issues

Transcript

I'll look at the logs to see what
happened

Check
logs

✗ Machine is past due for maintenance

I've captured the underlying
issue in the details

```
{  
  "name" : "John Clar  
  "issue": "Washing m
```

Go beyond transcriptions and slot
filling by allowing agents to deduce
the *why*

Acting aka tool calling

Fill out and submit the workorder

Populate field:
name

Populate field:
issue

✓ Name field populated

✓ Issue field populated

Submit
form

The form has been successfully

Agents can take a simple request and
chain multiple tool calls to complete the
ask

Learning aka memory

Assign technician

Update work
order

✗ Alex is already booked at this same time

+ Saved memory: Alex is OOF next week

Let me try again with an
available technician.

Update work
order

✓ Successfully assigned technician

Only make a mistake once. With memory,
agents can recall prior experiences

What are agents?

AI designed to perform a task

Tasks can vary in level of complexity and capabilities depending on your need

Simple

Generation

Generate summaries, images, audio, and more with an AI model and inputs.

Generally available

Retrieval

Retrieve information from grounding data, reason, summarize, and answer user questions

Generally available

Action

Take actions to automate workflows, and replace repetitive tasks for users

Generally available

Advanced

Before AI Agents

Today, many customers use generative AI for knowledge retrieval (aka RAG)...

A customer is having an issue with their washing machine W100 making too much noise; can you help me diagnose the issue?

Search: W100 manual

It looks like there might be three different issues that could lead to too much noise:

- Unbalanced Load**
If the clothes inside are unevenly distributed, especially during the spin cycle, the drum can wobble and cause loud banging or thumping sounds.
- Worn Drum Bearings**
Over time, the bearings that help the drum spin smoothly can wear out, leading to grinding or rumbling noises, particularly during spinning.
- Loose or Damaged Parts**
Items like shock absorbers, suspension springs, or drive belts can become loose or damaged, resulting in clunking, squealing, or rattling sounds.

You should create a ticket for a technician to take a look

Before AI Agents

But most downstream processes are still brittle and require meaningful human involvement

Before AI Agents

But most downstream processes are still brittle and require meaningful human involvement

Employees waste time structuring data

Nearly all automation today starts with form over data which is slow and error prone.

RPA breaks whenever UI is updated or changed

Teams must constantly monitor existing RPA scripts to ensure they do not break.

Automation cannot self-heal or handle novel cases

Complex logic is needed to handle unexpected edge cases within automation systems.

After AI Agents

With AI Agents, you can make your automation more **resilient** while removing the drudgery from work

LLMs spend little time structuring data

LLMs update RPAs if the UI updates or changes

Tool calling LLMs can self-heal or handle novel cases

After AI Agents

And when combined with system events, you can *fully* automate business processes with AI Agents

LLMs spend little time structuring data

Convert the customer conversation into a JSON that looks like this...

Transcript

Here you go!

```
{  
  "name": "John Clar  
  "issue": "Washing m  
}
```

Would you like me to submit the JSON to the API?

LLMs update RPAs if the UI updates or changes

Click on the submit button for the scheduling form

Looks like the ID of the order form is submit-order, I'll go ahead and click it now.

Submit form

The form has been successfully submitted, is there anything else you need?

Tool calling LLMs can self-heal or handle novel cases

Assign technician

Update work order

✗ Alex declined because they're on leave

Let me try again with an available technician.

Update work order

✓ Successfully assigned Lindsay

Spectrum of LLM-based Solutions

No Agent

Very narrow one shot task

Ex: log to JSON

Single Agent

Very clearly scoped iterative task

Ex: providing an answer with supporting evidence to a complex question

Multi-agent Systems

Wide scope complex use case requiring diverse skills

Ex: Propose 2 Instagram marketing campaigns including assets that would leverage the top 2 recent trends in our past quarter US Sales to boost our mailing list user base and predict the impact of each campaign

VALUE

Components of AI Agents

- 1. User Experience:** The prompt that starts the whole process of the agent execution, as well as the human-agent interaction.
- 2. Knowledge:** Search and retrieve information from online sources or company knowledge base, to ground the models.
- 3. Actions:** Helps the agents perform certain actions (e.g. send an email, write a report) through connections to key applications.
- 4. Memory and Threads:** Captures and stores the past interactions for hyper-personalisation and increased human-like interactions
- 5. Autonomy:** Leaves the agents perform the tasks through an event-driven, trigger-based approach.
- 6. Foundation Models:** Enables AI Agents to think throughout the process, helping to plan and reflect.
- 7. Orchestrators:** Whether to be the client-side code or orchestrate across multiple agents across multiple cloud, orchestrators are key to bringing everything together.

Agentic AI capabilities

Where agents are used today

Customer Use Cases

Agent Use Case #1

Customer support and engagement

Customer story

Commerzbank developed a banking avatar that allows customers to get the questions answered in natural spoken language. The avatar can provide information about the customer's banking products and enables the digital execution unblocking a current credit card or changing limits.

Agent Use Case #2

Sales and marketing support agent

Customer story

Fujitsu developed an AI agent, designed to incorporate the expertise of top sales professionals. It helps sellers prioritize customer leads, focus their efforts effectively, and craft personalized proposals tailored to each lead's specific needs. Their **AI Agent** drove a **67% increase in productivity** for **sales proposal creation**.

Internal IT ticket management

NTT DATA

NTT Data uses a multi-agent system to automate internal IT ticketing. Agents handle self-service, ticket creation, classification, routing, and resolution—integrating with ITSM and escalating to support teams when needed. This streamlines issue resolution and reduces manual workload.

Agent Use Case #4

Multi-agent renewal automation

Agents coordinate to assess renewal risk, generate strategies, ensure compliance, and automate customer communications—streamlining the entire license renewal process.

Customer story

Gainsight developed a multi-agent solution that involves several agents working together to manage customer license renewals. The orchestration agent initiates the process, followed by the insight agent assessing the client's renewal likelihood by connecting to Dynamics 365, and the strategy agent creating a renewal plan. Finally, the supervisor and communication agent ensure compliance and send the renewal email.

Agent Use Case #5

AI-Driven Security Automation

The MDR agent coordinates multiple tools to automate incident detection, impact analysis, and response actions—filtering false positives, mapping impacted entities, and executing playbooks at scale.

Customer story

ContraForce built an AI-powered Agentic Security Delivery Platform (ASDP) using Azure AI Agent Service to help security service providers automate multi-tenant operations and scale incident response. Their first agent, an AI-driven MDR agent, filters false positives, executes responses, and preserves institutional knowledge—**80% of repetitive triage tasks automated**, freeing analysts to focus on high-impact work.

Challenges in Development with AI Agents

Successfully developing AI Agents requires

4 primary considerations

Knowledge

Providing agents with the right context

Actions

Giving them the tools to complete their tasks

Security

Ensuring they only have access to what they should

Evaluation

Ensuring they complete their tasks correctly

So far, building agents from scratch been difficult to do

```
... messages (chat history) from MongoDB using the thread ID and sort them by creation date
chatHistory = new(s)
... will be asked to upload the local ./disco.wav to the python tool. If the user forgets, go ahead and upload it for them
... you will then be given a command to run some python code, run it using the python-run tool.

The first time you run it, it will fail, so tell the user you're going to fix it, but actually just run the code again.
""");
var messages = await _messagesCollection.Find(m => m.ThreadId == run.ThreadId).SortBy(m => m.CreatedAt).ToListAsync();
foreach (var message in messages)
{
    chatHistory.Add(message);
}
int messageCount = messages.Count;

// Invoke the chat completion service
var results = chatCompletionService.GetStreamingChatMessageContentsAsync(
    chatHistory: chatHistory,
    executionSettings: new OpenAIPromptExecutionSettings() {
        // Allows the AI to automatically choose and invoke functions from the kernel's plugins
        ToolCallBehavior = ToolCallBehavior.AutoInvokeKernelFunctions
    },
    kernel: kernel
);

// Return the results as a stream
var completeMessage = new StringBuilder();
await foreach (var result in results)
{
    completeMessage.Append(result);

    // Send the message events to the client
    var events = assistantEventStreamService.CreateMessageEvent(run.Id, result);
    foreach (var messageEvent in events)
    {
        yield return messageEvent;
    }
}
chatHistory.AddAssistantMessage(completeMessage.ToString());

// Get the new messages within the chat history
var newMessages = chatHistory.Skip(messageCount + 1).ToListAsync();

Dictionary<string, Tuple<string, string>> functionCallNames = new();

foreach (var message in newMessages)
{
    // Save the new messages to MongoDB
    await _messagesCollection.InsertOneAsync(
        new AssistantMessageContent() {
            AssistantId = run.AssistantId,
            Role = message.Role,
            ThreadId = run.ThreadId,
            Items = message.Items
        }
    );
}
```

Tool Integration

Creating a cohesive system through complex integration of various tools and APIs that have different interfaces, data formats, and requirements.

Interoperability

Achieving interoperability between different tools and platforms to ensure that data can be shared and understood across different systems.

Scalability

Handling increased data volumes, more complex computations, and higher user loads without degrading performance.

Real-time Processing

Ensuring tools can handle real-time requirements without significant latency.

Maintenance

Making labor-intensive updates to integrated tools for compatibility with new versions and prevention of obsolescence and security vulnerabilities.

Flexibility

Modifying or customizing existing tools or developing new ones to meet unique requirements.

Error Handling

Ensuring errors are handled gracefully and continue functioning despite tool failures or unexpected inputs is critical for reliability.

Security

Implementing robust encryption, access controls, and compliance with privacy regulations to protect sensitive data.

Organizations need platforms that enable rapid development of performant, secure AI Agents

Current Frameworks

Lack of integrated tools, insecure data grounding, challenging orchestration

Ineffective deployment of AI across websites, applications, and production environments

Restrictive pre-defined models that are challenging to customize

Security and data privacy risks

What's Needed

Connected complex workflow automation grounded by seamless connection to enterprise data

Tools and APIs that seamlessly integrate across enterprise applications

Flexible models that enable processing and integration of information from multiple modalities or types of data

Secure, responsible AI that protects sensitive information and behaves compliantly

Instructions

You will help generate a personalized email message for a customer who is interested in automating a business process with AI using Microsoft products.

You will then use this information to perform the following steps in order:

1. **Perform research** – use the Bing search tool to find relevant information about the industry and business process and how AI can be used to automate it.

It's currently November 21st, 2024, use announcements that just happened at Microsoft Ignite 2024.

Create 3 parallel searches for features from Copilot Studio, Azure AI Foundry, and Microsoft 365 Copilot.

- You **must** ensure the email does not include any references to competitors to Microsoft.

Azure AI Agents – Hands-On-Labs

Lab Description

- This repo provides a series of hands-on labs for building and orchestrating AI Agents using the Azure AI Agent Service SDK. You will learn to set up your Azure environment, deploy models, create and connect agents, and build advanced multi-agent system.

Questions?
